Dr. Cariss expressed the opinion that Volta piled disks of different metals one on top of another and separated the disks with moist pieces of cloth. Thus he generated a steady current. This was called the "Voltaic pile"—the first battery, the first generator of electricity.

Both Galvani and Volta were careful experimenters, but Volta's correct interpretation of effects gave us electrical engineering.

Napoleon was the outstanding figure in the days of Galvani and Volta. He too possessed an active interest in science but only as an aid to Napoleon. He little imagined the immense effect that his work would have on the art of batteries and electricity.

The effects of the work of Galvani and Volta may be traced down to the present day. Galvani and Volta discovered a fundamental principle of electricity, and this principle has been used by scientists ever since. Galvani and Volta laid the foundations of modern electricity, and their work has been built upon by generations of scientists.
